### FunGLASS research center in Slovakia established with €25M, including €15M from EU's Horizon 2020

The global glass community received excellent news of a €25 million investment in glass research to establish the new Centre for Functional and Surface-Functionalized Glasses (FunGLASS) in Trenčín, Slovakia. The Centre includes partner institutions in Germany, Spain, and Italy.

The establishment of this European centre boosts the momentum and importance of glass research on a global scale. The purpose of the Centre is to conduct cutting edge research on glasses with special functional properties, as well as investigate novel strategies for functionalizing conventional glasses. The aim is to modify properties and add new functionalities to expand the range of applications in the optical, energy, structural, and biomedical sectors.

Prof. Galusek, director of the Centre, says, "This Centre will be an important asset for the Slovak Republic mainly due to the fact that it will participate at cutting edge research in cooperation with some of the leaders in the field, generating high added value in all major activities, both in teaching, fundamental science and industry-driven research. The latter is ensured by close links of the Centre with the local glass industry. We also believe the Centre is of importance for the glass technology sector. Its activities will be focused at those technologies where properties of glass can be substantially altered or new functionalities added by surface treatment, at low energy or material cost, to generate a host of applications for high-tech uses."

The European Commission H2020 program awarded €15 million under the scheme H2020-WIDESPREAD-01-2016-2017-Teaming-Phase2 to establish the Centre. Also, the project has additional funding of at least €10 M from the Ministry of Education, Science, Research and Sports of the Slovak Republic.

The lead institution for the project is the Alexander Dubček University of Trenčín, Slovakia, under the direction of D. Dusan Galusek. Cooperating institutions and their lead investigators are

- Friedrich-Alexander University Erlangen – Nuremberg, Germany (Aldo R. Boccaccini),
- Friedrich Schiller University of Jena, Germany (Lothar Wondraczek),
- Institute of Ceramics and Glass of Spanish National Research Council in Madrid, Spain (Alicia Durán), and
- University of Padova, Italy (Enrico Bernardo).

Research at the Centre will focus on five main application areas: i) Biomaterials / materials for healthcare, (ii) Optical materials, including materials with luminescence properties, (iii) Materials for energy-related applications and low-carbon processing, (iv) Other functional materials (i.e. electric, magnetic, etc.), and (v) Structural glass-based materials.

Where applicable, areas will further divide horizontally, in terms of: a) processing and characterization, b) coatings and sol-gel methods, c) high-temperature processing, and additive d) manufacturing approaches.

Kick-off meeting at TNUAD in Trenčín on 7th March 2017

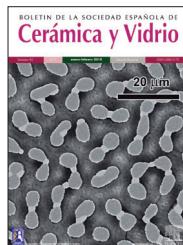

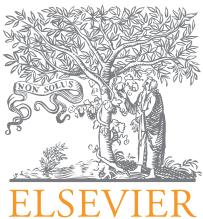

The core funding will be used to upgrade the existing National Glass Centre in Trenčín, Slovakia, and establish an internationally recognized new hub for research and innovation in glass. Tasks between now and 2023 include creating and formalizing coordination and management structures of the new Centre, building the premises, upgrading the research infrastructure, and expanding staff capacity.

Special attention is paid to hiring outstanding researchers and engineers. Project leaders anticipate approximately 40 new jobs for researchers at all career stages and auxiliary staff. Recruitment began in March 2017.

The funding will allow partners to create a motivating environment not only for researchers from the Slovak Republic, as well as experts from other countries. The goal is to build a multidisciplinary, creative, highly competitive, and inspiring environment for conducting cutting edge research to develop glasses for a variety of applications. Continuous education and training through extensive scientific exchange programs and the creation of international doctoral degree programs issuing double diplomas with project partner institutions will ensure that scientists and Ph.D. students from the Centre develop the desired qualifications.

A kick-off meeting for the new Centre in Trenčín on March 7-8, 2017, included authorities from the Ministry of Education, Science, Research and Sports of the Slovak Republic, representatives of the European Commission, authorities of the Alexander Dubček University of Trenčín, and the international partners from Germany, Spain, and Italy.

### Libro: Solidification and Solid-State Transformations of Metals and Alloys

José Antonio Pero-Sanz Elorza, Catedrático de las Escuelas de Minas de Madrid y Oviedo, María José Quintana, Profesora de la Universidad Panamericana de México, y Luis Felipe Verdeja, Catedrático de la Escuela de Minas de Oviedo, son los autores del libro *Solidification and Solid-State Transformations of Metals and Alloys* publicado por Elsevier en Marzo de 2017. Se trata de la versión actualizada del libro *Materiales Metálicos. Solidificación, Diagramas, Transformaciones* publicado por el Profesor Pero-Sanz en 1988 (Editorial Dossat S. A., actualmente agotado). El libro trata los aspectos básicos de la metalurgia física: estructuras cristalinas, solidificación, diagramas de equilibrio, transformaciones de fase, fundamentos de tratamientos térmicos, diagramas ternarios, que justifican las propiedades más singulares de los materiales metálicos (tenacidad, ductilidad y resistencia mecánica) y los califican frente a sus competidores industriales (cerámicos,

polímeros y compuestos). Se dedica una parte extensa del libro (capítulo VIII) al estudio del diagrama Fe-C metaestable, fundamento de los aceros (material metálico más utilizado en el mundo, y segundo material en aplicación y consumo después del cemento) y fundiciones blancas.

El libro *Solidification and Solid-State Transformations of Metals and Alloys* conduce al lector desde el metal o aleación líquidos hasta el producto industrial metálico, con una exposición rigurosa, clara, gradual y de implicación creciente en la metalurgia física y estructural. La génesis oral de las páginas del libro señalada en el prólogo explica su tono, sus referencias incidentales a algunos aspectos de interés para la praxis industrial, e incluso sus fronteras temáticas. El Profesor Pero-Sanz, con dilatada experiencia docente universitaria (su obra *Ciencia e Ingeniería de Materiales*, 4<sup>a</sup> edición, recibió el premio al mejor libro de texto en la Universidad Politécnica de Madrid, 1997) y en cursos de Postgrado, realiza una notable síntesis que facilitará la compresión de obras específicas dedicadas a aleaciones, todo ello complementado con los aportes del Profesor Luis Felipe Verdeja y la Profesora María José Quintana.

Concebido para cursos institucionales (planes de estudio vigentes) de escuelas de ingeniería o facultades universitarias, trata de prestar servicio a un amplio espectro de lectores: desde estudiantes hasta industriales interesados en los principios y utilización de metales y aleaciones.

El libro se encuentra estructurado en los siguientes capítulos:

- Solidificación de un metal puro. Consideraciones generales.
- Cinética de las transformaciones de fase.
- Aleaciones. Insolubilidad total y solubilidad.
- Solidificación invariante
- Solidificación de no equilibrio. Heterogeneidades químicas.
- Heterogeneidades físicas en la solidificación.
- Transformaciones de equilibrio en estado sólido.
- Transformaciones en estado sólido en el sistema Fe-C.
- Diagramas ternarios.

El libro, versión inglesa, fue publicado en marzo de 2017 por la editorial Elsevier y se encuentra disponible en la web:
